Dear Paddy

Re: Installation of Solar Water Heating System in 2 Richmond Wood

I just wanted to let you know how happy I am with the new system recently installed at our home. As you know, we embarked on a major upgrade of the existing property to include complete upgrade of insulation, central heating system and decided to also use the opportunity to install a solar water heating system.

Since installation of the AMK Collectors (evacuated tube system) in mid March, the panels have peaked at a temperature of 81 degrees Celsius. I turned off the water heating via our condenser boiler on the 6th April (9 days ago) and since then have been relying completely on the solar panels to meet our domestic hot water requirements. There has been mixed weather since the 6th April but there has been a continuous supply of hot water available. We have also opted to have the panels supplement our central heating system and we are already seeing the benefits in lower heating oil consumption.

When deciding on a system, my Architect was adamant that evacuated tubes would be better than a flat panel system – I must say that I tend to agree. I was sceptical about the benefit of solar systems and indeed their efficiency prior to installation. I have to say that I am delighted that my Architect convinced me to go down this route and wish to compliment you on your technical advice and friendly service – it is very much appreciated.

Wishing you continued success.

Kind regards,

Colin R Morehead
